NETIGMA HELP

Welcome to NETIGMA Help Page

NETIGMA allows you to create applications without coding knowledge!

You can create object queries and relatedly, printable and web based reports then extract them. You can easily change the content of your application: introduce new records or update the existing ones.

One of the outstanding feature of NETIGMA is its unique map integration; you can use your spatial data and turn them into application, or you can just use this capability to insert your business related data into map. Addition to standard queries, you can create map queries, and search your business data in map. Moreover with NETIGMA, business processes can be created and managed; over it you can make inspecting system logs and process based authorization definitions.

To learn more about NETIGMA and How To use it , you can refer the following titles. NETIGMA Help pages will guide you to create your NETIGMA applications.
